

# The discounted utility model

$Z = \{z_1, z_2, \dots, z_m\}$  set of basic outcomes  $T = \{0, 1, 2, \dots, n\}$  a set of dates

$t = 0$  is now,  $t = 1$  is one period from now ...

$(z, t)$  : **outcome  $z$  experienced at date  $t$**

Preferences over the set of dated outcomes: indexed by the date at which the preferences are being considered:

$(z, 1) \succ_0 (z', 2)$  means:

RESTRICTION:  $(z, t) \succ_s (z', t')$  implies that

$U_s$  utility function that represents the preferences at date  $s$ :

When the preferences at time  $s$  are restricted to outcomes to be experienced at time  $s$  then simpler notation  $u_s(z)$ :

$$u_s(z) =$$

Call  $u_s(z)$  the *instantaneous utility of  $z$  at time  $s$* .

Begin with preferences at time 0 (the present):  $\succsim_0$  represented by  $U_0(\bullet)$ .  
The **discounted or exponential utility model** assumes that these preferences have the following form:

(\*)

$(z, t) \succsim_0 (z', s)$  if and only if

**Example 1.**  $z$  = take online yoga class,  $z'$  = take in-person yoga class

$$(z, 1) \sim_0 (z', 3)$$

If her preferences satisfy the discounted utility model then

Suppose that  $u_1(z) = 4$  and  $u_3(z') = 6$ .

1. Then what is her discount factor?
  
  
  
  
  
  
  
  
  
  
2. What is her discount rate?

$$U_0(z, t) = \delta^t u_t(z)$$

Suppose you have a choice between  $(z', 0)$ ,  $(z, 0)$  and  $(z, 1)$

$z' =$  do nothing      and       $z =$  carry out a particular activity

$$U_0(z', 0) =$$

$$U_0(z, 0) =$$

$$U_0(z, 1) =$$

Suppose that  $u_0(z') = 0$  and  $u_1(z) = u_0(z)$  so that  $U_0(z, 1) =$

- $u_0(z) < \underbrace{0}_{=u_0(z')}$

- $u_0(z) > \underbrace{0}_{=u_0(z')}$

## Ranking sequence of outcomes

	<i>Today</i>	<i>Tomorrow</i>
<i>date</i>	0	1
<b>EXAMPLE 2.</b> <i>Plan A</i>	<i>x</i>	<i>y</i>
<i>Plan B</i>	<i>y</i>	<i>x</i>

Suppose:  $u_0(x) = u_1(x) = 4$        $u_0(y) = u_1(y) = 6$        $\delta = 0.8$ .

	<i>Today</i>	<i>Tomorrow</i>
<i>date</i>	0	1
<i>Plan A</i>		
<i>Plan B</i>		

Extension of the discounted utility:

$$U_0(\text{Plan A}) =$$

$$U_0(\text{Plan B}) =$$

**EXAMPLE 3.**

<i>date</i>	0	1	2
<i>Plan A</i>	<i>x</i>	<i>y</i>	<i>z</i>
<i>Plan B</i>	<i>y</i>	<i>z</i>	<i>x</i>

$$U_0(\text{Plan A}) =$$

$$U_0(\text{Plan B}) =$$

Suppose  $\begin{cases} \delta = 0.9, \\ u_0(x) = 0, u_1(y) = 4, u_2(z) = 2, \\ u_0(y) = 3, u_1(z) = 1, u_2(x) = 1 \end{cases}$ , then

<i>date</i>	0	1	2
<i>Plan A</i>			
<i>Plan B</i>			

$$U_0(\text{Plan A}) =$$

$$U_0(\text{Plan B}) =$$

## Time consistency of preferences

<i>date</i>	0	1	2	3
<i>Plan A</i>	–	<i>x</i>	<i>y</i>	<i>z</i>
<i>Plan B</i>	–	<i>y</i>	<i>z</i>	<i>x</i>

Suppose that you “choose” Plan *B*:

Now when date 1 comes along you re-examine those two plans and are free to change your mind (there was no commitment). Your preferences are **time consistent** if at date 1 you maintain the same ranking that you had at time 0:

Recall

$$U_0(z, t) =$$

Extend this to the preferences at any time  $s$ :

$$U_s(z, t) = \quad \text{assuming that}$$

$$U_s(z, t) = \quad \text{assuming that } t \geq s$$

	Date 0	Date 1	Date 2	Date 3	Date 4
Plan A	--	--	x	y	x
Plan B	--	--	y	z	x

$$U_0(\text{Plan A}) =$$

$$U_1(\text{Plan A}) =$$

$$U_2(\text{Plan A}) =$$

And similarly for the utility of Plan B.

Now suppose that at time 0 you prefer Plan A to Plan B:

(\*\*)

Divide both sides of (\*\*) by  $\delta$  :

Divide both sides of (\*\*) by  $\delta^2$  :
